DANIELIAN ASSOCIATES

AI Pursuit Intelligence

A Business Development Proposal from Technijian

Danielian's next pursuit is already visible in public data **right now** — a developer just recorded a deed; a planning commission posted a multifamily project for entitlement review; a national builder filed an early environmental notice in a corridor SB 79 just upzoned. None of it lands on Deborah's desk until it's an RFQ — and by then KTGY and AO Architects are already on the short list. **AI Pursuit Intelligence changes that sequence.**

Prepared for: Deborah Muro, Director of Business Development · Victor Alvarez-Duran, Chief Technology Manager

CONFIDENTIAL — prepared exclusively for Danielian Associates.

01 How Danielian Finds Work Today — and Where the Gaps Are

3–12 mo	24	7+	~$10.5K
Signal arrives before the RFQ	Tier-1 leads in one 75-min run	Public-data signal layers	90-day pilot (published tier)

Danielian wins through relationships, reputation, and responsive pursuit execution. That model has produced 6,353 projects and 1M+ housing units across 57 years. It is not broken. But it has a structural blind spot: **the signal arrives too late.**

Developer buys land	→	6–12 months pass	→	RFQ released	→	Danielian learns of it
public record, day 1		informal architect talks begin		3–4 firms pre-positioned		when the call comes in

By the time a formal RFQ lands — posted to a public bid board for agency work, or simply arriving as a call or email for a private developer pursuit (where there is no public posting at all) — two things are already true: the developer has had informal architect conversations, and three or four firms with standing relationships are already positioned. The pursuit is still winnable — but it's uphill. The firm that knew six months earlier, when the land recorded and the entitlement clock started, got the first call.

What Deborah's team is doing manually today (estimated; confirm at discovery)

- Monitoring a handful of developer websites and LinkedIn feeds
- Watching for RFQ postings on PlanetBids, eBidUSA, or direct developer emails
- Keeping tabs on a network of referrals and broker relationships
- Attending events and reading AEC trade coverage for deal announcements

This is not a failure of effort. It's a **coverage problem**: the signal universe is orders of magnitude larger than any team can monitor manually. Building-permit and entitlement data is spread across California's 58 counties and their hundreds of cities, each with its own portal. Dozens of OC-area planning commissions post project agendas weekly. CA HCD tracks density-bonus and builder-remedy applications. County recorders log every land transfer. National builders file early environmental notices months before a design team is announced. No BD team reads all of it. An AI system can.

02 What AI Pursuit Intelligence Delivers

AI Pursuit Intelligence is a multi-agent, multi-source monitoring system configured specifically around Danielian's buyer universe and service lines. It is not a contact list. It is not email blasting. It is not Apollo or ZoomInfo. It works in four stages.

Stage 1 — Harvest (continuous, automated)

Seven or more data layers are monitored in near-real-time:

Signal Layer	What It Surfaces	Why It Matters for Danielian
Building permit filings	Multifamily, BTR, ADU-batch, and mixed-use permits across OC, LA, and Nashville jurisdictions	Project in permit = an architect is already selected; the gap to close is the pre-permit entitlement stage
Planning commission & DRB agendas	Projects moving through entitlement approval (weekly postings from 10+ jurisdictions)	Entitlement approval = design-team selection within 90–180 days; Danielian can be in the room *now*
CEQA / EIR filings	Environmental notices for large residential and mixed-use projects	Big projects file early; an EIR is a 12–18 month signal *before* the RFQ
County recorder — land transfers	Deed records: developer names, parcel size, acquisition price	Developer just bought land = site feasibility + architect selection is imminent
CA HCD filings	Density-bonus applications, builder-remedy projects, affordable-housing pipeline	Directly in Danielian's product lines; many are not widely publicized
SB 79 / ADU / middle-housing triggers	Transit-adjacent parcels newly upzoned (SB 79, eff. 7/1/2026); 8-ADU-per-lot projects (SB 1211)	New legislation creates new project types in Danielian's core categories
Developer & national-builder news	PR, permit filings, and announcements from national/regional CA builders (D.R. Horton, Lennar, Toll Brothers, Tri Pointe, Taylor Morrison, Brookfield)	National builders announce communities months before architect selection; local developers signal through PR

Stage 2 — Enrich (AI-powered, per signal)

- Developer / owner identity (if not in the record)
- Project-type classification (multifamily / BTR / ADU / affordable / mixed-use / SFR)
- Jurisdiction and entitlement pathway; estimated project size and timeline
- Danielian's past work in that jurisdiction or with that developer (cross-referenced vs. the 6,353-project archive)
- Existing-relationship flag: "Danielian has done 3 projects with this developer" vs. "first contact"

Stage 3 — Score (prioritized by Danielian criteria)

- **Fit** — does the project type match Danielian's core lines?
- **Relationship** — existing connection to this developer, landowner, or municipality?
- **Timing** — is it at a stage where outreach lands (pre-RFQ, not post-award)?
- **Market** — active Danielian geography (OC, LA, Nashville, or an expansion target)?

Output: a prioritized **Tier-1 pursuit list** — not a raw dump of 500 records, but a curated set of 20–40 high-fit opportunities with full context.

Stage 4 — Deliver (weekly brief to Deborah's team)

- **New Tier-1 signals** — projects that just hit the radar and match Danielian's criteria
- **Account dossiers** — per signal, a pre-meeting brief on the developer (pipeline, past architect partners, decision-makers)
- **Existing-relationship triggers** — "XYZ Developer, who you worked with in Irvine in 2019, just recorded a deed in Torrance — worth a call"
- **Legislative / market triggers** — "SB 79 created 12 new density-eligible parcels in the Metro Rail corridor this week — here are the owners"

03 Why This Is Fundamentally Different from Current Outreach

Most “lead generation” services for professional-services firms fall into one of two traps. This is neither.

What Most Firms Use	The Problem	What AI Pursuit Intelligence Is Instead
Apollo / ZoomInfo	Cold contact lists; generic demographic filtering; no signal about why-now or what-project; the same list every competitor buys	Real-time public-data signals tied to *specific projects and events* — not demographic profiles
Email-blast campaigns	A volume play that commoditizes Danielian alongside every other firm in the inbox	Project-specific, relationship-informed outreach tied to a concrete trigger
Manual BD monitoring	Throttled by what one or two people can physically watch; misses most of the signal universe	Automated coverage of the full public-data footprint across every relevant jurisdiction, 24/7
Reactive RFQ response	Danielian learns about the project when competitors may already be pre-positioned	Signals arrive 3–12 months *before* the RFQ, when Danielian can still shape the conversation
Referral / relationship only	High-quality but supply-constrained; relies on the network to surface the opportunity	Complements the network — Danielian still wins through relationships; the AI surfaces the right moments to activate them

The critical distinction: this is not a cold-list play. It is a timing play.

Danielian already has the relationships. The product of 57 years is not just 6,353 projects — it’s a network of developers, homebuilders, planners, and municipalities who already know the Danielian name. AI Pursuit Intelligence tells Danielian *when* those relationships should be activated, and surfaces *new* ones to build before the competition does. A developer Danielian has never met just recorded 14 acres in an SB 79 transit corridor. They are about to need an architect who knows multifamily and density-bonus design. Danielian can be in that conversation in week two — or wait for the RFQ in month eight.

04 Why Now — the 2026 Context Makes This Urgent

Three factors are compressing the window simultaneously.

1. California housing legislation is generating new projects in Danielian's exact categories

- **SB 79 (effective July 1, 2026):** transit-corridor upzoning creates new multifamily and mixed-use feasibility on previously constrained parcels. Developers are running pencil-outs *right now*; architect selection follows 90–180 days later.
- **SB 1211:** up to 8 detached ADUs per multifamily lot — a new product-type calculation for every existing multifamily developer relationship Danielian has.
- **ADU streamlining + SB 9 expansion:** continued volume of ADU and middle-housing work in Danielian's pipeline territories.

The firms in the room when developers are figuring out SB 79 feasibility will be on the short list when the project is greenlit. That entry window is open *now*, for roughly six to nine months.

2. The AEC market is bifurcating between AI-ready and AI-behind firms

Per the 2025 Deltek Clarity survey: 53% of A&E firms use AI and 94% plan to increase usage, but only ~20% feel "highly prepared" — a 55-point readiness gap. The firms that close it in 2026 will operate faster, win more pursuits, and present smarter to developers. The firms that wait will feel the pressure in 2027.

3. Danielian's largest competitors have the scale to move first

KTGY and AO Architects are larger, well-resourced firms with strong digital presences — the kind most able to invest in AI ahead of smaller peers. The window where AI-augmented BD is a differentiator, not a table stake, is measured in months, not years. Danielian's countervailing advantage: it can move faster and more decisively than a large firm's committee.

05 Proof — Already Running in Danielian's Market

This is not a theoretical system. A near-identical pursuit-intelligence build is already live for a **luxury custom-home builder in Orange County**.

Element	Detail (anonymized; scope + effort only)
Client	Luxury custom-home builder, Orange County coastal market
Problem	15–20 hours per week of manual portal-reading across permit databases, HOA ARC committee agendas, story-pole filings, and just-sold records
Solution	Multi-agent pipeline: 7 signal layers, 10 permit jurisdictions, 60+ HOA ARC committees
Result on day one	**24 enriched Tier-1 leads in a single 75-minute run** — replacing the week's manual work
Signal sources	County permit portals, city building departments, HOA ARC agendas, county recorder (just-sold), story-pole filings, coastal-commission filings

This is **the same terrain Danielian's developer universe moves through**. The permit portals are the same. The planning-commission agendas are the same jurisdictions. The county recorder is the same. The signal logic translates directly — from the builder looking for replacement/remodel homeowners to the architecture firm looking for developers with active projects.

The adaptation for Danielian

- Buyer type shifts from homeowner-prospect to developer / builder / municipality
- Signal focus shifts from residential story-poles and HOA ARCs to multifamily entitlement filings, CEQA notices, and density-bonus applications
- Enrichment adds relationship cross-reference against Danielian's 6,353-project archive, developer profiling, decision-maker research
- Scoring adds Danielian's specific pursuit criteria (project type, geography, relationship history)

Same engine. Same public-data foundation. Danielian-specific configuration.

06 What Deborah Muro's Team Gets, Day to Day

Before	After
Monday: check public bid boards and inbound RFQs	Monday: open the **weekly Pursuit Intelligence Brief** — 20–40 scored, enriched opportunities with context
Weekly: scan a handful of developer sites and LinkedIn feeds	Per brief: review Tier-1 signals — new projects that just became visible
As it comes: track referrals and inbound calls	Per dossier: developer background, decision-makers, and Danielian's prior history with them
Quarterly: review pipeline; identify coverage gaps	Per trigger: a flag when a dormant relationship has a live project — a warm call, not a cold one
Ongoing: react to whatever the market surfaces	Quarterly: pipeline metrics in EOS Scorecard format — new signals, contacts, pursuits, win rate

The team does not search. The team **receives**. They spend their time on the call, the relationship, the proposal — not on reading planning-commission PDFs.

Victor Alvarez-Duran's read (governance)

A governed, auditable AI pipeline with clear data sources, no hallucinated contacts, and documented enrichment logic.

No vendor lock-in to a data broker — built on public data and Technijian's proprietary multi-agent pipeline; pluggable into whatever CRM or pursuit-tracking tool Danielian uses (or a lightweight system if none exists). The firm's 6,353-project archive becomes the relationship-history backbone.

John Danielian's read (EOS)

One EOS Rock: "Q3 Rock — Pursuit Intelligence Pilot: establish 40 Tier-1 accounts by July 31, score them, contact 20 before Q3 ends."

Scorecard metric: **hours-to-first-contact** (from project signal to Deborah's outreach), tracked weekly. A measurable, accountable investment — not a vague "digital transformation."

07 What This Is Not

This is not cold-list blasting. Every outreach Deborah makes is triggered by a specific project signal with context. “We noticed your entitlement application in the Santa Ana planning commission” is not a cold email — it’s a warm, informed opening.

This is not “AI will find you new clients by itself.” The AI surfaces the signal and the context. The relationship is still built by Deborah’s team. The architecture is still designed by Danielian’s architects. The win is still earned through craft, reputation, and proposal quality.

This is not replacing the referral network. Referrals from builders and developers who already know Danielian are the highest-value signal. This system supplements them with systematic coverage of the market the referral network doesn’t reach.

This is not demographic data brokering. No purchased lists. No cold-contact databases. Every signal originates in public records — the same records Danielian could theoretically check manually, at a scale and speed no manual process can match.

08 Investment & ROI Framework

Entry Scope (Pursuit Intelligence Pilot)

Component	Description
Signal architecture build	5–7 data layers configured for Danielian's buyer universe (multifamily, BTR, ADU, affordable, SFR) across OC + LA jurisdictions
Enrichment & scoring layer	Developer profiling, Danielian-relationship cross-reference, project-type + timing scoring
Weekly Pursuit Intelligence Brief	Formatted weekly delivery to Deborah's team; EOS-ready KPI format
Pilot period	90-day pilot; weekly signal briefs + monthly review

The pilot runs on **My AI Lead Gen's published service tiers** — no invented pricing:

My AI Lead Gen Tier	Monthly	Scope
Starter	$1,499/mo	1 vertical · 500 leads/mo
Professional (the fit for Danielian)	**$3,499/mo**	3 verticals · daily runs · 2,500 leads/mo
Enterprise	$6,999/mo	Unlimited verticals · 10K+ leads/mo

Danielian's buyer universe spans several "verticals" (multifamily, BTR, ADU, affordable, mixed-use), which maps to the **Professional tier ($3,499/mo)** — about **$10,500 for the 90-day pilot** — plus a one-time signal-architecture configuration for Danielian's specific jurisdictions and 6,353-project relationship cross-reference (scoped at the discovery quote). Any annual-commitment discount, and the Phase 2 expansion (Nashville + full national-builder coverage), are confirmed at scoping.

ROI Framework (model with Danielian data at discovery)

Input variables to confirm with Deborah / Jeff Schmehr: average project fee (likely $200K–$1M+ for multifamily/BTR); current annual pursuit win rate (typical AEC 25–40%); average hours-to-proposal (typically 40–120 hrs); number of pursuits tracked actively.

Illustrative model (rebuilt with Danielian's actual figures at discovery)	Value
Additional qualified pursuits surfaced per quarter (conservative vs. the 24-lead OC run)	3 / quarter
Danielian win rate assumed on the new signals	1 of 3 (33%)
Average project fee assumed (conservative OC/LA multifamily)	$350,000

Illustrative model (rebuilt with Danielian's actual figures at discovery)	Value
Result — 1 added win per quarter × 4 × $350K	**~$1.4M / yr incremental**

Against a ~$10,500 pilot investment, the break-even is a fraction of a single additional win. The metric that makes this undeniable to Jeff Schmehr: **what is one earlier-stage pursuit worth to Danielian?**

Efficiency model (hours recovered)

If Deborah's team spends even 5 hours/week on manual signal monitoring (conservative), that's 260 hours per year of BD research time. AI Pursuit Intelligence reduces that to review time (30–60 minutes per week to read the brief) — **~230 hours/year recovered**, redirected from portal-reading toward relationships and proposal quality.

09 Relationship to the Broader AI Growth Program

AI Pursuit Intelligence is one module within a larger picture — not the full Technijian program for Danielian. Here is how it fits.

ENTRY PLAY (now)

- AI Workshop / Readiness (as an EOS Rock) — $5K one-time
- Fractional AI Advisor (program governance) — ~$24K/yr
- AEO Authority Content (named-developer audience) — ~$12K/yr

PURSUIT ENGINE (next: AI Pursuit Intelligence)

- Signal architecture + enrichment build (this proposal)
- Weekly Pursuit Intelligence Brief
- EOS Scorecard integration (pursuit KPIs)

INSTITUTIONAL KNOWLEDGE (expansion)

- 6,353-project knowledge graph (Weaviate + My AI)
- Entitlement / code research assistant
- Proposal / SOQ automation (days → hours)

FOUNDATION

- Secure IT + M365 + AI governance across 3 offices (My IT / My Compliance)

Entry-program figures are planning estimates carried from the Danielian AI Growth Report; My SEO bills at published rates, while the AI Workshop, Fractional AI Advisor, and build line items are confirmed at quote. The only committed scope in this proposal is the Pursuit Intelligence pilot priced in Section 8.

The Pursuit Intelligence build runs standalone as a pilot — it does not require the full program. But it compounds when the institutional knowledge graph is built (the relationship cross-reference gets richer as more of Danielian's archive is indexed) and when proposal automation is live (surfaced leads flow directly into accelerated proposal assembly).

10 Why Technijian, Why Now

1. We have already built this in Danielian's market.

The OC luxury-homebuilder system in Section 5 uses the same data sources — OC county permit portal, city planning portals, county recorder, HOA ARC agendas — relevant to Danielian's developer universe. We are not proposing a new capability; we are proposing to redirect a proven system toward Danielian's buyer personas.

2. The SB 79 window is time-bounded.

SB 79's transit-corridor upzoning becomes effective July 1, 2026. Developers are running feasibility on newly upzoned parcels now, in spring and early summer 2026. Architect conversations follow 90–180 days later — putting the opportunity squarely in Q3–Q4 2026. A system built in July captures the wave; a system built in October misses most of it.

Deborah Muro's team is the right team to activate this. Danielian already has the relationships, the portfolio, and the reputation. The only gap is the systematic intelligence layer that tells those relationships *when* to call — and introduces the new ones before the RFQ.

11 Proposed Next Steps

Step	What Happens
1. Discovery call (30–45 min)	Deborah + Victor (optional Jeff). Confirm pursuit pipeline size and win rate; existing tech stack (CRM, pursuit tracking, any AI in pilot); target developer list; Q3 2026 geographies and project-type priorities; EOS Rock timing.
2. Signal-architecture scoping (1 week)	Technijian maps the specific signal sources, jurisdictions, and enrichment logic for Danielian's exact buyer universe. Output: a one-page architecture doc and pilot scope with fixed investment.
3. 90-day pilot	Weeks 1–2: build + test harvest + enrichment. Week 3: first Pursuit Intelligence Brief delivered. Weeks 4–12: weekly briefs, scoring tuned, EOS Scorecard set up. End: review vs. baseline (signals surfaced, contacts made, pursuits entered, hours recovered).
4. Full-market expansion	Extend to Nashville, layer in national-builder pipeline monitoring, connect to the institutional knowledge graph as it is built.

The first move is a 30-minute discovery call.

Confirm the numbers, name the crown-jewel developer relationships that seed the intelligence system, and lock the Q3 EOS Rock — so the first Pursuit Intelligence Brief is on Deborah's desk inside three weeks, while the SB 79 window is still wide open.

Appendix Key Contacts at Danielian Associates

Name	Title	Role in this engagement
Deborah Muro	Director of Business Development	Primary champion; weekly-brief owner; pursuit activation
Victor Alvarez-Duran	Chief Technology Manager	Technical champion; system governance; integration
Jeff Schmehr	CFO	ROI gate; Scorecard accountability
John Danielian	President	Approval; EOS Rock sign-off

Technijian · Managed IT, Cybersecurity & AI Solutions · 18 Technology Dr., Ste 141, Irvine, CA 92618 · technijian.com · rjain@technijian.com
