

Technijian

for The Holman Group

Co-managed IT, security, and strategic support — alongside your team, not over it.

First meeting | Ravi Jain, Founder & CEO ↔ Deric Hobbie, Network Administrator | June 19, 2026 · 11:00 AM PT · Microsoft Teams

Behavioral health & EAP · ~60 endpoints · on-prem servers · in-house IT team · HIPAA / Knox-Keene / URAC

18 Technology Dr. Ste 141, Irvine CA 92618 · technijian.com · 949.379.8499 · technology as a solution

WHY WE'RE HERE

A working conversation — on your terms

Lewis connected us because you're weighing whether an outside partner could complement your in-house IT. That's exactly the conversation worth having.

OUR PROMISE TODAY

We're not here to take over your network. We're here to find the two or three places where an outside team genuinely takes work off your plate — and to leave you with something useful either way.

You keep control.

We fill the gaps a single in-house team can't staff around the clock.

1

What we heard from you

~60 endpoints, on-prem servers, in-house IT — said back so we can correct anything.

2

Who Technijian is

25+ years, security-first, a dedicated team model — in 20 seconds.

3

Where a partner actually helps

The co-managed model: augment your team, don't replace it.

4

Security & compliance for a health plan

HIPAA, Knox-Keene, URAC, 42 CFR Part 2 — what a partner shoulders.

5

Your questions

The heart of the meeting — your environment, your priorities.

6

A free, no-commitment next step

A security read of your environment that's yours to keep.

WHAT WE HEARD

Your environment, said back to you

From your conversation with Lewis. If we got anything wrong, now's the time to fix it — this is your meeting.

~60

COMPUTERS / ENDPOINTS

On-prem

SERVERS IN-HOUSE

In-house

IT TEAM YOU RUN

Regulated

HIPAA · KNOX-KEENE · URAC

WHAT THAT TELLS US

You already run real IT. An in-house team and on-prem servers means you don't need someone to take the wheel — you need depth and coverage on top of what you've built. That's co-management, not outsourcing.

On-prem + regulated raises the bar. Physical servers to patch, back up, and secure — plus PHI under HIPAA, Knox-Keene, and URAC — is a lot for one team to cover 24/7 with audit-ready evidence.

Behavioral-health data is high-value. Mental-health and substance-use records (42 CFR Part 2) are among the most sensitive — and most targeted — data there is. The security floor for a plan like yours is simply higher.

WHO WE ARE

Technijian, in 20 seconds

Enough to know we're a serious, local, security-first partner — then back to you.

SINCE 2000

25+ years, still here

An Irvine-based IT firm founded in 2000, with a Panchkula, India delivery center for true follow-the-sun coverage. We're not a flip-this-MSP startup — we'll be here for the long relationship.

THE POD MODEL

A team that knows you

You get a dedicated pod — a named team that learns your environment — not a different stranger on every ticket. It's the single thing clients tell us they were missing before.

SECURITY-FIRST

Built in, not bolted on

CISSP-led, with our own 24/7 Security Operations Center and CrowdStrike / Huntress-grade tooling. Security isn't an add-on line item for us — it's how we run everything.

AI-FORWARD

We build, not just resell

We develop practical AI and custom software (our My Jian platform, document intelligence, automation) — so the strategic conversation goes beyond keeping the lights on.

HOW WE WORK

The kind of work we do for shops like yours

Representative engagement profiles — the shape of the work we deliver, no client names and no cherry-picked numbers. The pattern is always the same: add depth without stepping on the in-house team.

PROFILE A · REGULATED HEALTHCARE

HIPAA practice, co-managed

A multi-site healthcare organization with its own IT lead. Scope: hardened Microsoft 365, EDR across endpoints and servers, a HIPAA Security Rule risk assessment, and audit-ready evidence — run alongside their admin, who stayed in charge throughout.

We added depth; the in-house lead kept control.

PROFILE B · ON-PREM + IN-HOUSE IT

24/7 overlay, nights back

A mid-market org with on-prem servers and a small internal team carrying the pager. Scope: a 24/7 SOC overlay plus after-hours help-desk so the in-house staff got nights and weekends back, with patch and backup discipline tightened across the server estate.

The internal team got nights and weekends back.

PROFILE C · CLAIMS / BENEFITS OPS

Document & workflow AI

A benefits-operations workflow heavy with manual document handling. Scope: AI document-intelligence and workflow automation explored to cut repetitive processing — the same pattern we'd look at for EAP intake and claims, once the IT foundation is solid.

The pattern we'd explore for EAP intake & claims.

Different situations, one constant: we add depth and coverage without taking the wheel from your in-house team.

THE CORE IDEA

Co-managed means we work for you, not instead of you

The old pitch was all-or-nothing: hand us your network and step aside. That's not this. Co-management keeps you in charge and plugs specific gaps.

All-or-nothing outsourcing

(the model you're right to distrust)

- Replace the in-house team
- Tickets go to rotating strangers
- You lose visibility and control
- Your admin gets sidelined
- One rigid bundle, take it or leave it

Co-managed with Technijian

(augment what you run)

- Your team stays in charge
- A named pod that learns your stack
- We cover the gaps you choose
- Your admin is force-multiplied + mentored
- Pick the layers you actually need

1

You keep control

Your team owns the relationship and the roadmap. We never make changes you didn't approve, and you can see everything we do.

2

We cover what one team can't

24/7 SOC, after-hours and weekend response, surge bandwidth for projects, PTO coverage — the things a single in-house team simply can't staff alone.

3

Augment, not replace

On your worst week we're the bench you call. On a normal week, you barely notice us — and your admin grows by working next to ours.

A FEW WAYS WE COULD HELP

Three places a partner usually earns its keep

Not a menu to buy today — hypotheses to react to. Tell us which of these is real for you, and which isn't.

TAKE WORK OFF THE PLATE

Co-Managed IT & Help Desk

Tier-1/2 overflow and after-hours / weekend coverage, patching and monitoring, Microsoft 365 administration, and surge bandwidth for the projects you can never get to. Your team sets the priorities; we add the hands.

You set the priorities; we add the hands.

COVER WHAT YOU CAN'T WATCH

24/7 Security & HIPAA

A 24/7 SOC, EDR on every endpoint and server, email security, and identity hardening — plus HIPAA / Knox-Keene / URAC evidence and risk assessments. The coverage and audit trail one team can't sustain alone.

The coverage one team can't sustain alone.

BEYOND KEEPING THE LIGHTS ON

Strategic IT + AI Efficiency

A vCIO/vCISO planning cadence — and practical AI for your operation: EAP intake triage, claims and document intelligence, provider-network matching. The efficiency conversation, once the foundation is solid.

The layer most MSPs don't bring.

Most teams your size feel one of these the most. Today's job is finding out which — then going deep there.

SECURITY & COMPLIANCE

Six layers a behavioral-health plan has to cover

You could build any one of these. The hard part is running all six, 24/7, with evidence a regulator will accept. Which keep you up at night?

LAYER 01

Identity & access

MFA on every login, conditional access, and privileged-account control. Most breaches start at a stolen sign-in — so this is where we lock down first.

LAYER 02

Endpoints & servers

EDR + threat detection on every laptop and on-prem server, disk encryption, and enforced patching — on the network and off it.

LAYER 03

Email & web defense

Anti-phishing, malicious-link protection, and DNS/web filtering. Healthcare is the most-phished sector there is; most attacks arrive in the inbox.

LAYER 04

Data, backup & ransomware

Immutable, tested backups of your servers and Microsoft 365 with fast recovery. Production storage and a sync are not a backup.

LAYER 05

Compliance evidence

HIPAA Security Rule risk analysis, policies, and audit-ready documentation — including 42 CFR Part 2, CMIA, Knox-Keene, and URAC IT controls.

LAYER 06

24/7 SOC & response

Eyes-on-glass monitoring with a defined response when something looks wrong — the around-the-clock coverage an in-house team can't staff alone.

YOUR TURN

The questions that actually shape a fit

This is the part that matters most. The more candid you are here, the more useful our free assessment and any proposal will be.

1

Walk me through the environment — how many servers and endpoints, and what's on-prem versus already in Microsoft 365 / the cloud?

2

Where does your team's time actually go — help desk, patching, projects, after-hours fires?

3

When something breaks at 2 AM or over a holiday weekend, who gets the call today?

4

On security: what's your current EDR / SIEM / email-security stack, and when was your last HIPAA risk assessment or penetration test?

5

How do you produce the IT-side evidence for HIPAA, 42 CFR Part 2, Knox-Keene, and URAC today — and how painful is it?

6

What projects are on your roadmap this year that you'd love more bandwidth for?

7

Besides you, who weighs in on a decision like this — finance, compliance, the CEO?

8

What would make this conversation worth your time today?

A FREE FIRST STEP

Start with a no-commitment read of your environment

Before anyone talks contracts, we give you something useful — a clear picture of where you stand, yours to keep.

FREE · NO CONTRACT · YOURS TO KEEP

Nexus Assess

A security and risk read of your actual environment:

- Internal + external vulnerability scan
- Dark-web credential exposure check
- Microsoft 365 security configuration review
- Prioritized roadmap mapped to HIPAA

No obligation. Whether or not we ever work together, the roadmap is yours to act on with your own team.

01

Today — discovery

A relaxed conversation about your environment and what matters most. No commitment.

02

Free Nexus Assess

We scan and review, then hand you a plain-language, HIPAA-mapped risk roadmap.

03

Right-sized co-managed proposal

Only the layers you actually want, scoped to your real environment — every line explained.

THE NEXT STEP

One small step. **Nothing to sign.**

RECOMMENDED

Book your free Nexus Assess

We scan your environment and Microsoft 365, then hand you a prioritized, HIPAA-mapped roadmap within about 10 business days — yours to keep, no contract, no obligation.

HAPPY TO SHARE

Our security + AI playbook

I'll walk you through the broader security and practical-AI playbook we run for ourselves and our clients — useful context whether or not we work together.
