EMAIL SECURITY HASN'T KEPT PACE WITH THE THREAT

Every modern breach tour starts in the inbox. Attackers are using generative AI to write perfect phishing at scale, hiding payloads in QR codes, hijacking real conversations mid-thread, and weaponizing compromised accounts from the inside. Most legacy email gateways — and even Microsoft's built-in defender — weren't designed for any of this.

AI-Generated Phishing at Scale

Generative AI has cut the time to author a convincing phishing email from ~16 hours to ~5 minutes. Volume is up, quality is up, and keyword-based filters miss most of it.

Business Email Compromise

Wire-change requests, vendor impersonation, and payroll-redirect scams caused \$3.05B in reported US losses in 2025 (FBI IC3). Legacy anti-spam has no signal to catch them.

QR Code Phishing ("Quishing")

QR codes inside PDFs and images bypass URL scanners. Users scan on their phone, skip corporate protections, and land on a credential-harvesting page.

Compromised-Account Email

Once an employee's Microsoft 365 account is taken over, every email they send is already "trusted." Perimeter gateways never see it — only internal-mail protection does.

Brand Forgery & Look-Alikes

Spoofed Microsoft, DocuSign, and bank emails look perfect to SPF/DKIM — because the domain checks pass. Only computer-vision AI catches the visual forgery.

Security Awareness Fatigue

Annual SAT modules and quarterly phishing simulations don't stick. Users need coaching in the moment they're about to click — not months earlier in a slide deck.

My AntiSpam

Solves all six — Technijian-managed INKY platform at a flat \$4.75/user. Computer-vision AI, QR decoder, internal-mail protection, inline user coaching, and 24/7 SOC triage — every feature included, no upsells.

A TECHNIJIAN-MANAGED EMAIL SECURITY SERVICE — POWERED BY INKY

Technijian My AntiSpam is a **fully managed email security service built on the INKY platform**. INKY (now part of Kaseya) pioneered computer-vision AI for email threat detection — the same kind of visual analysis a trained analyst would do, applied automatically to every message. Technijian handles the integration, tuning, policy, and 24/7 SOC triage so your team never touches the console.

POWERED BY INKY

INKY was founded in 2008 and has operated as a SOC 2-audited email security platform for more than a decade. Its computer-vision engine was built years before the current GenAI wave — the platform now combines image, behavioral, and language-model signals to stop threats that signature-based tools cannot see.

- ✓ Computer-vision AI for brand-forgery detection
- ✓ GenAI-assisted behavioral analysis & BEC defense
- ✓ QR-code / quishing scanning inline
- ✓ Internal-mail protection for compromised accounts
- ✓ SOC 2-audited platform (Deloitte)

WHAT TECHNIJIAN ADDS

Raw INKY is a powerful platform — but it still needs policy design, connector setup, allow-list tuning, banner rollout, and day-to-day triage. Technijian wraps the platform with our 24/7 U.S.-based SOC so your team gets enterprise email security without hiring an email-security analyst.

- ✓ OAuth onboarding in under an hour — no MX swap
- ✓ Custom policy, allow-list & banner tuning
- ✓ 24/7 SOC triage & user-report handling
- ✓ Monthly threat-report & executive dashboard
- ✓ Integration with Technijian My Security stack

HOW A MESSAGE MOVES THROUGH MY ANTISPAM

INKY BY THE NUMBERS

Trusted by MSPs, Banks, Hospitals & Law Firms

INKY is deployed across thousands of organizations in regulated industries — healthcare, finance, legal, manufacturing, and public sector — where the cost of a single successful phishing click can mean millions in breach costs, regulatory penalties, and reputational damage. Technijian brings enterprise-grade INKY coverage to mid-market teams at a price that finally fits.

THREE PROTECTION LAYERS, ONE FLAT PRICE

Inbound Mail Protection

Every inbound message passes through INKY's computer-vision, GenAI, and behavioral engines before it reaches the user. Brand forgery, malicious links, weaponized attachments, and GenAI-authored phishing are flagged, quarantined, or banner-warned — in real time.

Computer Vision URL Defense Attachment Scan GenAI Detection Brand Forgery

Internal Mail Protection

When an employee account is compromised, their outbound mail is already “trusted” — perimeter gateways never see it. INKY's internal-mail module inspects account-to-account email and catches lateral phishing, CEO fraud, and payroll-change scams inside your tenant.

Lateral Phishing CEO Fraud Anomaly Detection Post-Delivery Remediation

Outbound DLP & Data Protection

Catch sensitive data leaving your tenant before it becomes an incident. Policy-driven detection for PHI, PCI, PII, tax IDs, and custom patterns. Automatic encryption, block, or admin-alert on policy match. Full audit log for compliance evidence.

PHI / HIPAA PCI PII Custom Patterns Encrypt On Send

Inline User Coaching & Reporting

Color-coded safety banners appear at the top of every email explaining “why this is safe” or “why this looks suspicious” in plain English. A one-click report button in Outlook and Gmail lets users flag anything that slipped through — no more “forward as attachment” training.

Red / Yellow / Green Outlook Add-in Gmail Add-on One-Click Report Just-in-Time Training

Admin Console, Reporting & Integration

Technijian operates the admin console for you, but full visibility is yours. Threat dashboards, quarantine management, user-report queues, allow/block lists, and exportable reports are available anytime. SIEM export and webhook alerts plug into existing SecOps workflows.

Threat Dashboard Quarantine SIEM Export Webhooks Monthly Reports

ADMIN CONSOLE — AT A GLANCE

Threat Timeline

Live view of blocked threats, reason codes, and affected users. Filter by date, severity, or threat type.

Quarantine Queue

Review quarantined messages, release false positives, and tune allow-lists with full context on each decision.

User Reports

See every user-reported phishing attempt, Technijian triage outcome, and remediation status in one dashboard.

Executive Reports

Monthly PDF + live dashboard: threats blocked, top spoofed brands, user report rates, DMARC posture.

HOW INKY CATCHES WHAT KEYWORD FILTERS MISS

Traditional gateways score email on sender reputation, URLs, and keywords. Modern phishing looks clean on all three. INKY combines **computer vision**, **generative-AI signals**, and **behavioral analysis** to score what a message looks like, how it behaves, and whether it matches normal patterns for the sender and recipient — the way a trained analyst would.

Computer-Vision Brand Forgery

INKY renders the email the way a user sees it and compares logos, layout, and typography against legitimate senders. Spoofed Microsoft, DocuSign, Wells Fargo, Chase, and hundreds more are caught visually — even when DKIM and SPF pass.

GenAI-Assisted Phishing Detection

LLM-authored phishing has perfect grammar and convincing tone — keyword filters lose. INKY uses language-model features plus conversational context to spot the signatures of AI-generated social engineering, including thread-hijack attacks.

QR / Quishing Decoder

INKY decodes QR codes inline — even ones embedded in PDFs, PNGs, or screenshot attachments — and analyzes the destination URL before the user scans with their phone. QR phishing is one of the fastest-growing attack vectors since 2024.

Account Takeover & Internal Phish

Once an M365 or Google account is compromised, outbound email carries full trust. INKY's internal-mail module watches tenant-to-tenant messages for anomalous tone, timing, recipient patterns, and wire-change language — catching the attack from inside.

BEC & Vendor Impersonation

Classic BEC — CEO wire requests, vendor invoice changes, payroll redirects — uses zero malware, so AV is useless. INKY scores behavioral signals: first-time sender + urgency + payment request = block or banner, regardless of domain reputation.

Post-Delivery Remediation

When threat intelligence updates after delivery (e.g. a URL weaponized hours later), INKY claws back the message from every inbox that received it — even if the user already opened it. No more “delete this email” IT broadcasts.

WHAT USERS SEE — COLOR-CODED SAFETY BANNERS

DANGER

Likely phishing. The sender used a Microsoft logo but the domain is not microsoft.com. Do not click any links. · **Reported & blocked automatically.**

CAUTION

First-time sender. This email asks you to change wire instructions or move money. **Verify by phone** using a number you already have — not the one in this email.

SAFE

Confirmed domain match. DKIM and DMARC aligned. Sender has corresponded with this recipient before. No threat indicators detected.
