

PREPARED FOR CNBC

Technijian

for Creative Nonprofit Business Consultants

Securing a fully remote team — wherever your people log in.

Meeting briefing | Ravi Jain ↔ Cheryl Taylor (Owner & CEO) | Fri 2026-06-05 | 1:00 PM PT | Teams

Cybersecurity for a distributed, cloud-only nonprofit consultancy · 7 people · 4 states

18 Technology Dr. Ste 141, Irvine CA 92618 · technijian.com · 949.379.8499

AGENDA

What we'd like to cover today

A working conversation, not a hard pitch. You wanted to understand cybersecurity for a remote team, and pricing — so that's where we'll spend the time.

OUR GOAL TODAY

Give you a clear, plain-language picture of how a 7-person, fully remote team gets secured — and what it costs — so you can decide your next step with no pressure.

You bring the questions.

We bring straight answers — and we won't oversell a team your size.

1

What we heard from you

7 people, 4 states, no server, intern-run IT — said back to make sure we got it right.

2

Why remote is a different security problem

When there's no office network, the rules change. In plain terms.

3

How we secure a fully remote team

The six layers that protect each laptop and login — no server required.

4

What managed IT + security looks like

The Technijian services, right-sized to a small nonprofit consultancy.

5

Pricing — real numbers for seven

How we price, what 7 users runs, nonprofit savings, and the path to a firm quote.

6

Next step

A free, no-commitment security assessment of your setup.

WHAT WE HEARD

Your situation, said back to you

From your conversation with Jannea and Sierra. If we got anything wrong, today's the time to fix it.

ON-PREM SERVERS (CLOUD-ONLY)

1

INTERN RUNNING IT TODAY

WHAT THAT MEANS

Fully remote, no office network. Laptops in California, Arizona, New York, and Maryland — nothing tying them together but the cloud. You and your admin assistant work from a small office; everyone else is distributed.

Cloud-only. No server to defend — your work lives in Microsoft 365 and on each individual laptop. That changes where security has to live.

Cybersecurity is the priority — and there's no IT provider yet. A college intern has carried IT so far. You want professional protection for a distributed team, and a clear answer on what it costs.

THE CORE IDEA

When there's no office, every laptop is the front door

A fully remote, cloud-only team isn't a smaller version of an office — it's a different shape. Here's why, in plain terms.

The old model

(what you don't have)

- An office with one network
- A firewall at the door
- A server in a closet
- IT staff down the hall
- Everyone behind one wall

Your reality

(remote-first)

- 7 laptops, 7 home networks
- 4 states, multiple time zones
- Work in Microsoft 365 / the cloud
- Each login = the keys to everything
- No wall — each device on its own

1

The perimeter is gone

There's no office wall to hide behind. Each laptop is exposed on its own home or coffee-shop Wi-Fi — so protection has to live on the device itself.

2

The login is the new lock

Whoever controls your Microsoft 365 sign-in controls your data. Securing that login — with MFA and access rules — is job number one.

3

Protection must be remote-native

Tools that assume a server or an office don't fit you. Yours have to reach every laptop over the internet and manage it automatically.

THE GAP TODAY

Your intern got you here. Securing a distributed team is a team sport.

This isn't a knock on your intern — it's that protecting 7 laptops across 4 time zones, around the clock, is more than any one person can carry.

HARD FOR ONE PERSON — THROUGH NO FAULT OF THEIRS

What an intern can't cover

- 24/7 monitoring across multiple time zones
- After-hours and weekend incident response
- A documented, repeatable security baseline applied the same way to every laptop
- Accountability — guaranteed response times, and insurance behind the work
- Continuity when they graduate or move on — today the knowledge lives in one head

WHAT CHANGES WITH A MANAGED PARTNER

What a team adds

- A credentialed team and a 24/7 Security Operations Center behind every laptop
- Written security standards, applied consistently to all 7 devices
- One number to call — with defined, guaranteed response times
- Knowledge that stays — documented and owned by us, not stuck in one person
- We can mentor your intern alongside us (co-managed), so they grow with you

THE ANSWER TO YOUR QUESTION

How we secure a fully remote team — no server required

Six layers that travel with each person, wherever they log in. This is exactly what you asked us to explain.

LAYER 01

Identity & access

Multi-factor authentication on every login, smart access rules, and hardened Microsoft 365 sign-ins. The login is the new perimeter — we lock it down first.

LAYER 02

Every device protected

Managed antivirus + threat detection on all 7 laptops, disk encryption, and automatic updates — enforced over the internet, no office visit needed.

LAYER 03

Email & web defense

Phishing and spam filtering, malicious-link protection, and safe web/DNS filtering. Most attacks arrive by email — we stop them before the click.

LAYER 04

Data & backup

Independent, ransomware-resilient backup of your Microsoft 365 data with fast recovery. The cloud by itself is not a backup.

LAYER 05

Your people

Short security-awareness training and simulated phishing. Your team becomes your strongest layer instead of the weakest link.

LAYER 06

Eyes on glass, 24/7

A Security Operations Center watching alerts around the clock, with a defined response when something looks wrong — across every time zone your team works in.

THE TECHNIJIAN STACK

Five services — you'd start with just the first two

Each works on its own. For a team your size, My IT + My Security is the foundation; the rest are here when you grow.

MANAGED & CO-MANAGED

My IT

Help desk + monitoring + patching for your laptops and Microsoft 365. We can run it fully, or alongside your intern.

[Start here.](#)

24/7 SOC

My Security

EDR + email security + MFA-everywhere + 24/7 monitoring and response. This is the core of what you came to us for.

[Start here.](#)

WHEN CLIENTS ASK

My Compliance

HIPAA, SOC 2, and more — evidence and guidance for when a funder or client asks how you protect their data.

OUR SECURITY PLATFORM

My Jian

Technijian-built monitoring that watches across your tools and produces a plain monthly security report.

WHEN YOU'RE READY

My AI / My Dev

Practical AI and custom builds — a later conversation, only if and when it helps the mission.

WHY THIS MATTERS FOR YOU

For a firm that serves nonprofits, trust is the product

Security isn't overhead for CNBC — it's part of the credibility you sell to the organizations that rely on you.

You hold sensitive data

Client financials, grant and donor information, board materials. A breach there isn't just downtime — it's a hit to the trust your business runs on.

Your clients are starting to ask

Funders, boards, and partners increasingly ask consultants “how do you protect our data?” A clear, confident answer helps you win and keep work.

Nonprofits are targeted

Attackers see mission-driven organizations — and the firms that serve them — as softer targets. Being the secure consultant is a real differentiator.

Do more with less

Managed security gives a 7-person firm enterprise-grade protection without an enterprise budget — and gets you out of being the help desk.

Modeling good data stewardship isn't a cost for CNBC — it's part of the value you offer the nonprofits you serve.

PRICING

What it costs — real numbers for seven

You asked about cost, so here it is. This is how we price a team your size, using our standard small-business security packages. Your final, fixed quote is set after a free assessment.

WHAT PROTECTS EACH PERSON · PER MONTH

Endpoint security — EDR + threat detection + DNS filtering + patching + remote support **\$26.50**

Email security & archiving (anti-phishing / anti-spam) **\$4.75**

Microsoft 365 cloud backup **\$4.00**

Security-awareness training (simulated phishing) **\$6.00**

Managed help desk & 24/7 monitoring **~\$46**

Per person **≈ \$87 / mo**

+ Email-domain (DMARC/DKIM) monitoring — whole org **\$20 / mo**

Optional as you grow: encrypted email, advanced identity / single sign-on, deeper activity monitoring.

YOUR ESTIMATE — ALL 7 USERS

≈ **\$630**

per month · about \$90 / user

Before Microsoft 365 nonprofit licensing — often free or deeply discounted — lowers it further.

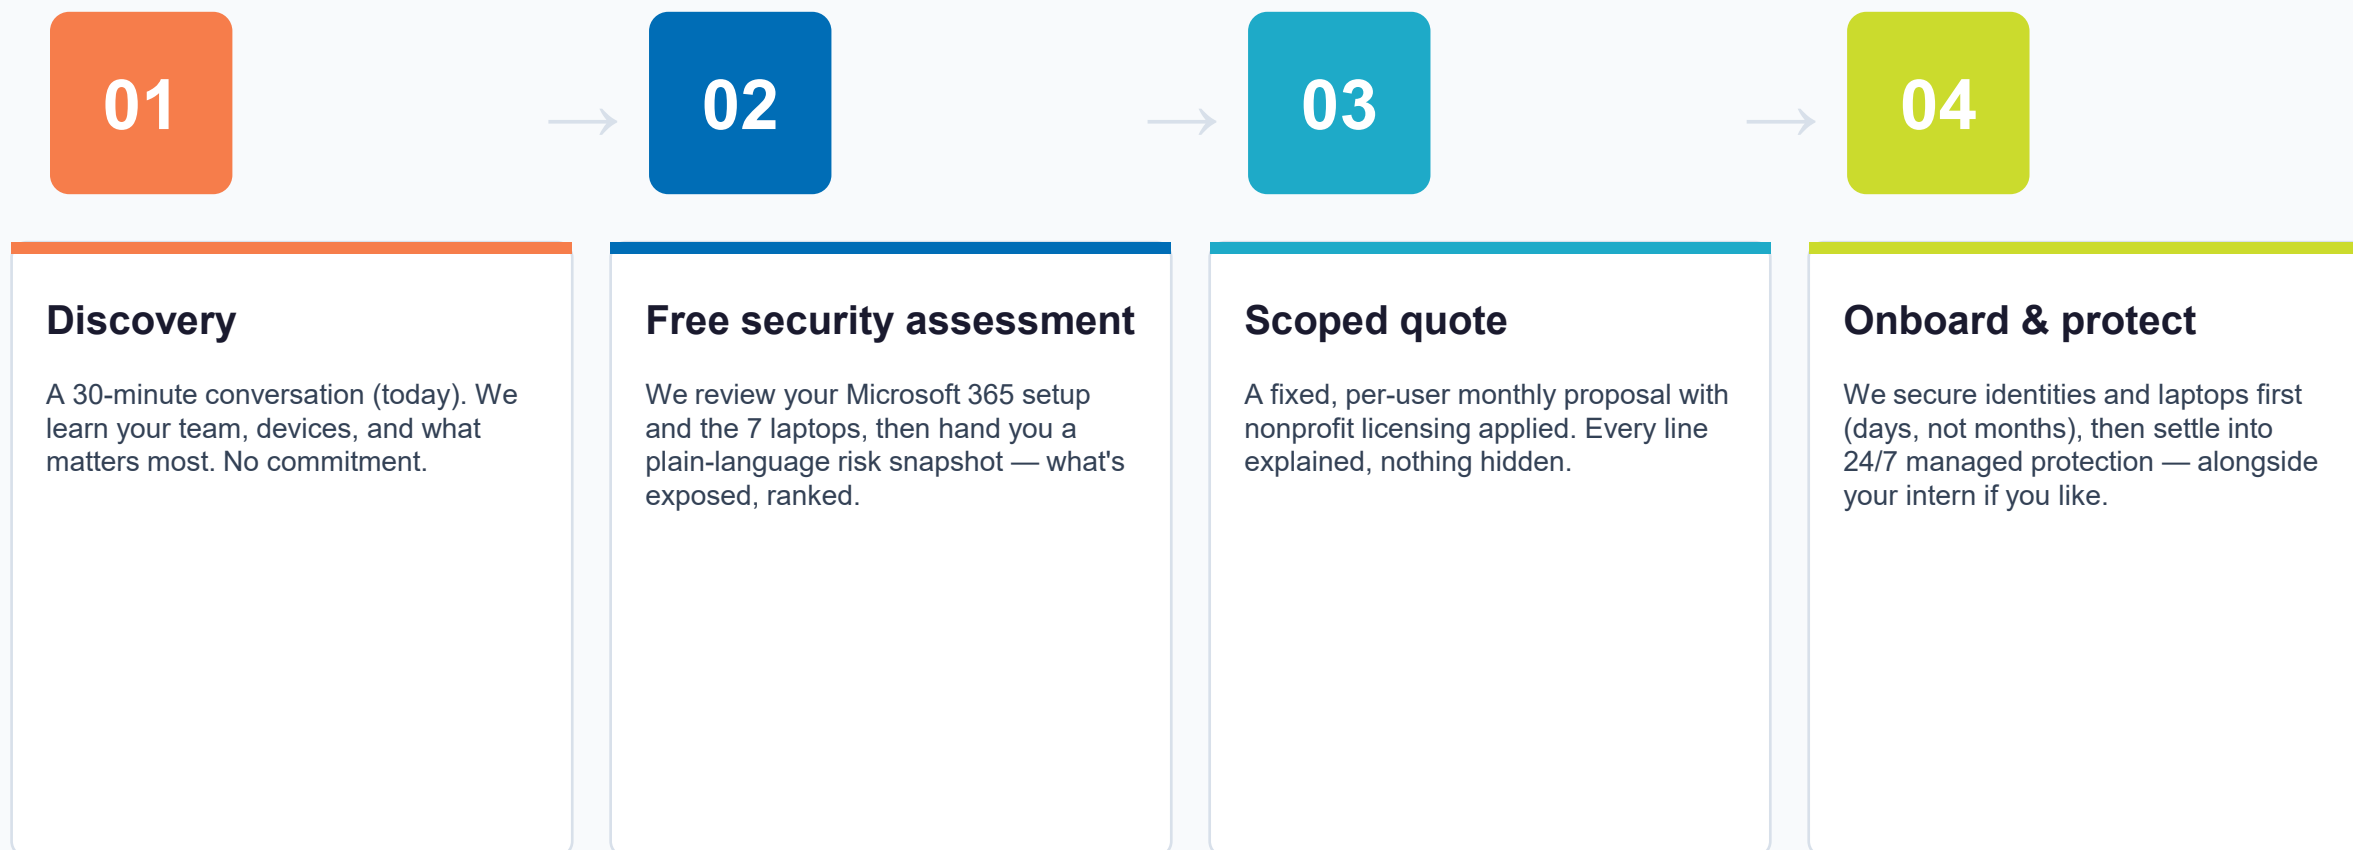

- Flat, predictable monthly — one bundle, billed per person.
- Every line shown — nothing hidden, you approve the scope.
- A fixed quote in writing after a free 30-minute assessment.

Illustrative estimate using our standard small-business security packages — the same way we price other 7-person teams. Final fixed monthly quote is set after a free assessment, and before nonprofit Microsoft 365 licensing.

HOW WE'D ENGAGE

Discovery first. Start small. No long lock-in.

A low-commitment path — a small first step that earns the right to the next one.

NEXT STEP

One next step. **No commitment.**

RECOMMENDED

Free remote-security assessment

We review your Microsoft 365 and your 7 laptops, then come back with a plain-language risk snapshot and a fixed, per-user quote — with nonprofit pricing applied. You decide from there.

YOU KEEP THIS EITHER WAY

A 1-page secure-remote-team checklist

A short, plain checklist of the protections every fully remote team should have — yours to keep and act on, whether or not we work together.
