

AI Lead Generation for a Luxury Home Builder

7-Layer Signal Architecture · OC Coastal Communities

How Technijian built a multi-agent AI system that replaces 15–20 hours a week of manual portal-reading with continuous monitoring across 10 jurisdictions, 60+ HOA committees, and 7 signal layers — delivering scored, tiered leads 3–6 months earlier than permit filings.

INDUSTRY	MARKET	CAPABILITY	DETECTION LEAD TIME
Construction · Custom Home Builder	OC Coastal (Newport, Laguna, Dana Pt)	Multi-Agent AI · Scraping · Enrich	3–6 months earlier than permit

THE CHALLENGE

A boutique luxury custom home builder can't competitively scale cold outreach. The owner's pre-automation workflow: manually check **10 permit portals on 5 different software platforms**, read monthly design-review-board agendas, monitor **60+ HOA architectural review committees**, watch for story-pole installs, track coastal development permits, skim Zillow/Redfin for buyer-agent signals, follow architect/designer Instagram, and skip-trace owners.

That's **15–20 hours a week** of pattern-matching public data before saying a word to a prospect. It scales linearly with cities covered — it doesn't scale at all in real terms.

- ✓ **10 permit portals** across 5 software platforms (Tyler EnerGov, eTRAKIT, Maintstar, custom ASP.NET)
- ✓ **60+ HOA ARC committees** across Newport Coast, Dana Point, Laguna Beach, Irvine
- ✓ **5 coastal cities** with Coastal Development Permit tracking
- ✓ **Design Review Board agendas** on Granicus, Legistar, CivicPlus
- ✓ **California Gov Code §7928.205** — public records can't disclose owner names; must skip-trace
- ✓ **Signals precede permits** by 2–4 months; builder was seeing them too late

THE SOLUTION — 7-LAYER SIGNAL ARCHITECTURE

A multi-agent AI system that watches the signals that **precede** the permit, not just the permit itself. Each layer is a discrete agent with its own portal-scraping logic, retry behavior, and output schema. The orchestrator deduplicates across layers and resolves addresses to APNs to stitch a single lead record from signals that appeared months apart.

ENRICHMENT & SCORING

Multi-source enrichment per lead: APN via county assessor + permit, assessed value via OC Assessor API, Laserfiche link to scanned permit docs, owner name + mailing address via ATTOM (dual-path APN / address fallback), phone + email via BatchData skip-trace, architect / designer parsed from plan-set PDF title block.

Pipeline correctly handles **California Gov Code §7928.205** (prohibits online disclosure of property-owner names from OC Tax Collector, Assessor, Recorder) — goes straight to paid skip-trace for names, saving cycles an analyst would waste.

TECH STACK

SCORING TIERS

SYSTEM SCALE

THE RESULTS — ONE PRODUCTION DAY

From the system's own run-index, one representative production day, five runs. The afternoon run surfaced **24 Tier-1 hot leads in 75 minutes** — each already enriched with assessed value, owner identity (via paid skip-trace), phone, email, and a direct Laserfiche link to the plan set.

RUN	DURATION	RAW	DEDUP	T1	T2	T3
morning (retry)	23m	53	24	0	5	19
mid-morning	46m	220	77	0	6	71
midday	48m	222	77	0	6	71
afternoon (final)	75m	216	194	24	36	134

AFTERNOON RUN — LAYER BREAKDOWN & ENRICHMENT YIELD

LAYER CONTRIBUTION (216 RAW)

Permits (10 jurisdictions)	173 raw
Design Review Boards	48 → 26 valid
Coastal Dev Permits	0 this run
Just-Sold	17 valid
County Recorder	104

ENRICHMENT YIELD ON THE 194 DEDUPED LEADS

ATTOM by APN	89 of 115 (77%)
ATTOM address fallback	50 of 73 (68%)
BatchData skip-trace	132 of 188 (70%)
Tier-1 actionable	24 leads

WHAT THIS UNLOCKS

- ✓ **3–6 months of earlier detection.** The builder is in the conversation before the prospect has picked a contractor — the signals that precede a permit (just-sold, ARC filings, story poles, DRB agendas) surface first.
- ✓ **No missed cities.** Manual monitoring of 10 portals across 5 software platforms doesn't happen reliably on any given week; the automation never skips a city.
- ✓ **Regulatory-aware.** Knows the limits of public property data in California; routes to paid skip-trace for owner names instead of wasting runtime on sources that can't legally disclose.
- ✓ **Compounding.** Every run is indexed; a lead that appeared at Layer 1 (just-sold) 3 months ago is reconciled with Layer 5 (permit filed) today — same APN, complete story.

REPRESENTATIVE OUTCOME

“A luxury custom home builder replaced 15–20 hours a week of manual public-records work with a multi-agent AI system watching 7 signal layers across 10 permit jurisdictions and 60+ HOA committees — and produced 24 enriched Tier-1 leads in a single 75-minute run on day one of production.”
