

Regional Construction Contractor Datacenter Migration & Azure AD Hybrid Identity

How Technijian moved a construction contractor's on-premise domain controller into the Technijian hosted datacenter, synchronized identity to Azure AD, and decommissioned legacy on-site servers — without disrupting the jobsite workday.

INDUSTRY	ENVIRONMENT	SERVICES ENGAGED	ENGAGEMENT SCOPE
Construction / Contractor	HQ + jobsite, hybrid identity	Hosted DC, Azure AD, Decomm	89 hrs across 3 phases

THE CHALLENGE

A regional construction contractor ran its core identity on an **aging on-premise domain controller** with several legacy supporting servers (DC03, DC04, FS01, TCM01). Hardware was past its useful life, the on-prem hosting model was increasingly expensive to maintain, and workstations needed **Azure AD integration** to align with how the company wanted to handle mobile / jobsite authentication going forward.

The contractor wanted to **retire the aging on-prem stack**, keep authentication running continuously during the move, and end up with a **hybrid-identity model** that worked equally well for HQ staff, field superintendents, and remote PMs.

- ✓ **Aging on-prem domain controller** past useful hardware life
- ✓ **Legacy servers** (DC03, DC04, FS01, TCM01) slated for decommission
- ✓ **Workstations need Azure AD** login for mobile / jobsite use
- ✓ **Zero tolerance for auth outage** during business hours
- ✓ **Hybrid identity** required to bridge HQ, field, and remote
- ✓ **No internal team capacity** to run a datacenter migration

THE SOLUTION

Technijian delivered the modernization in **three phases**: stand up Azure AD Connect sync from the existing on-prem DC, migrate the on-prem domain controller into the **Technijian hosted datacenter**, then decommission the obsolete on-site servers.

PHASE 1

Azure AD Sync

Install Azure AD Connect on the on-prem DC, configure sync rules, resolve conflicts, and establish continuous identity synchronization with Azure AD — workstations gain cloud identity without downtime.

PHASE 2

DC → Technijian DC

Back up existing DC, transfer to the Technijian datacenter, configure and validate new hosted DC. Migration progress updates every few hours; post-migration performance monitoring.

PHASE 3

Legacy Decommission

Verify all services migrated off legacy servers (DC03, DC04, FS01, TCM01). Decommission each server safely, document the process, dispose of hardware following best practices.

PLATFORMS & OPERATIONAL HIGHLIGHTS

- ✓ **Azure AD Connect** install, config, and ongoing sync monitoring
- ✓ **Hosted domain controller** in Technijian datacenter — managed, reliable
- ✓ **Service continuity** via staged migration — not a weekend big-bang
- ✓ **Formal decommission documentation** for each retired legacy server
- ✓ **Ongoing operations** — 65+ hrs across 59 tickets post-migration (12 mo)

PLATFORMS UNDER MANAGEMENT

- Active Directory
- Azure AD Connect
- Microsoft Entra ID
- Windows Server
- Technijian Datacenter
- VMware ESXi / vCenter
- Veeam Backup
- Microsoft 365
- ManageEngine RMM

WORK CATEGORIES (POST-MIGRATION, 12 MO)

- General support · 46 tkts
- Server admin · 7 tkts
- M365 admin · 3 tkts
- Backup/Recovery · 2 tkts

ENGAGEMENT SCALE

3 MIGRATION PHASES	89 HOURS (MIGRATION)	4 LEGACY SERVERS RETIRED	65 POST-MIG HRS (12MO)
-----------------------	-------------------------	-----------------------------	---------------------------

Retire the server closet. Keep the business running.

949.379.8500

THE RESULTS

Core identity now runs from the **Technijian hosted datacenter** with live **Azure AD synchronization** powering cloud sign-in for HQ, field, and remote users. Four legacy servers have been formally decommissioned. The contractor is out of the on-site hardware-refresh cycle and running a hybrid-identity model that matches how the business actually operates.

OUTCOME METRIC	RESULT
Identity synchronization	Azure AD Connect deployed on the on-prem DC, sync rules configured, conflicts resolved — continuous user-identity sync to Azure AD confirmed operational.
Domain controller relocation	On-prem domain controller backed up, transferred, and stood up in the Technijian hosted datacenter; migration progress reported every few hours; post-migration performance monitored.
Workstation Azure AD login	Workstations updated for Azure AD login — matching how field and remote users actually sign in and work.
Legacy server decommission	DC03, DC04, FS01, and TCM01 verified out of service after migration, safely decommissioned, and disposed of per best practices with formal documentation.
Operational continuity	Authentication available throughout the migration — staged cutover approach preserved business-hours service availability.
Post-migration operations	65+ hours of ticket work across 59 tickets over the following 12 months — snapshot consolidation, VMware tool upgrades, QNAP/Veeam backup cleanups, and patch cycles.

REPRESENTATIVE WORK

Azure AD Connect deployment — Installed and configured Azure AD Connect on the on-prem domain controller, tuned sync rules and schedules, resolved identity conflicts, and validated continuous synchronization.

Hosted DC migration — Backed up the existing domain controller, transferred the VM to the Technijian datacenter, configured and tested the new hosted DC environment, then validated service health.

Legacy decommission — Confirmed all services had migrated off DC03, DC04, FS01, and TCM01; performed controlled shutdowns; documented decommission and hardware disposal for each server.

Snapshot consolidation — Post-migration vCenter hygiene: identified VMs stuck on disk consolidation, initiated and completed consolidation jobs, verified services healthy.

VMware Tools upgrades — Brought production VMs (AD, SQL, TS/VDI) current on VMware Tools — eliminating a recurring class of failures from the incident queue.

Backup storage care — QNAP backup storage health monitored via Veeam; space reclaimed through snapshot and old-data cleanup; LUN warnings cleared and verified.

REPRESENTATIVE OUTCOME

“A regional construction contractor moved core identity out of the on-site server closet into the Technijian hosted datacenter, stood up live Azure AD synchronization for hybrid HQ / field / remote users, and decommissioned four legacy servers — with continuous authentication throughout the migration.”
