

Financial Services Firm

Infrastructure Stability & Compliance Posture

How Technijian delivered 12 months of infrastructure stability — VoIP, servers, network, endpoints, and M365 — for a financial services firm with regulators watching and clients expecting uptime.

INDUSTRY	ENVIRONMENT	SERVICES ENGAGED	ENGAGEMENT WINDOW
Financial Services / Advisory	HQ + SFTP + SQL + 3CX stack	VoIP, Infra, Network, M365, Sec	12 months · 240+ hrs

THE CHALLENGE

A financial services firm depended on a full-stack Windows environment — domain controllers, file servers, SQL, SFTP (for client file exchange), 3CX for advisor phone lines, and terminal servers for remote work. Every piece of that stack was **both business-critical and compliance-relevant**.

What the firm didn't have was a disciplined operations partner. Patching was ad-hoc. 3CX updates were postponed out of fear of breaking client calls. VMware Tools hadn't been touched in quarters. Firewall and wireless incidents took too long to close. And there was no ticket-based evidence trail to show a regulator that controls were actually being applied.

THE SOLUTION

Technijian took over **infrastructure operations** as a managed service: scheduled patch cycles, 3CX maintenance with snapshot rollback, network and wireless incident ownership, M365 admin, and endpoint management — all tracked as time-entry-backed tickets that double as compliance evidence.

- ✓ **Monthly patch discipline** across the server stack (3CX, AD, FS, OPSPRB, SFTP, SQL, TS) with one-by-one restart & service validation
- ✓ **3CX upgrade program** — full server backup, vCenter snapshot, Windows + 3CX patches, reboot, service validation, test calls before release
- ✓ **VMware Tools uplift** on production VMs (3CX, AD, FS, OPSPRB) to eliminate hypervisor-drift failures
- ✓ **Network & wireless ownership** — firewall maintenance, wireless survey, coverage fixes with proper change records
- ✓ **M365 administration** — user lifecycle, license right-sizing, security defaults, MFA enforcement
- ✓ **Evidence trail** — every action logged with technician, time, and verified outcome for compliance review

- ✓ **Patch debt** across DC, AD, FS, SQL, SFTP, and 3CX servers
- ✓ **3CX update anxiety** — fear of breaking advisor phone lines
- ✓ **VMware Tools drift** across production VMs
- ✓ **Slow network / wireless incident closure** with no clear ownership
- ✓ **No evidence trail** for patching, backup, and access controls
- ✓ **CVE exposure** building month over month without remediation cadence

PLATFORMS UNDER MANAGEMENT

3CX VoIP Active Directory SQL Server SFTP
 File Servers Terminal Server vCenter / VMware
 ManageEngine CrowdStrike Falcon Microsoft 365
 Firewall / Wireless

WORK CATEGORIES (12 MO)

VoIP ops · 85 tkts Network · 64 tkts Endpoint mgmt · 38 tkts
 M365 admin · 26 tkts Backup/Recovery · 14 tkts
 Server admin · 2 tkts

ENGAGEMENT SCALE

12 MONTHS MANAGED	230+ TICKETS RESOLVED	240+ HOURS DELIVERED	7+ SERVERS IN SCOPE
----------------------	--------------------------	-------------------------	------------------------

THE RESULTS

Patching moved from anxiety-driven and postponed to a predictable monthly cycle. 3CX upgrades run with snapshot safety and test calls before release — advisor phone lines are no longer held hostage to patch debt. Every action sits in a ticket history ready for compliance review.

OUTCOME METRIC	RESULT
Server patch cadence	Monthly cycle sustained across DC, AD, FS, OPSPRB, SFTP, SQL, TS, and 3CX VMs with one-by-one restart verification and service health checks.
3CX upgrade discipline	Full server backup plus vCenter snapshot before every upgrade; Windows + 3CX patches applied; services verified and test calls placed before release.
Hypervisor drift	VMware Tools brought current on production VMs (3CX, AD, FS, OPSPRB) — eliminating drift-class failures from the incident queue.
Network & wireless	Dedicated engagement for wireless coverage and network security (33h + 75h proposals) closing capacity and security gaps the incident queue had been masking.
M365 administration	User lifecycle, license right-sizing, security defaults, and MFA enforcement brought under a single managed workflow with audit-ready records.
Compliance evidence	Every patch, reboot, snapshot, and remediation logged with technician, time, and verified outcome — ready to hand to compliance or external audit.
Accountability	One partner, one ticket queue, one escalation path — no more debate about which vendor owns which layer of the stack.

REPRESENTATIVE WORK (12 MONTHS)

Post-patch restart discipline — After patch deployment, servers (3CX, AD, FS, OPSPRB, SFTP, SQL, TS) restarted one by one; automatic services verified post-restart; scan re-run through ManageEngine portal.

Monthly M365 operations — User provisioning, license right-sizing, security defaults review, MFA enforcement, and mailbox health checks.

Network security engagement — Dedicated 33-hour engagement covering firewall configuration review, remediation of identified vulnerabilities, and hardening recommendations.

3CX upgrade procedure — Full server backup, vCenter snapshot, Windows + 3CX patches applied, server rebooted, services verified running, test calls placed on advisor lines before releasing to production.

VMware Tools uplift — vCenter inventory review, identified drift across 3CX, AD, FS, OPSPRB VMs; initiated guest-side upgrades with rollback plan.

Wireless engagement — Dedicated 75-hour engagement covering wireless coverage, capacity, and security — closing a set of recurring user incidents at the source.

REPRESENTATIVE OUTCOME

“A financial services firm moved from ad-hoc patching and postponed 3CX upgrades to a predictable monthly operations cadence — with a ticket-based audit trail suitable for compliance review and a single accountable partner for every layer of the stack.”
