

Multi-Practice Healthcare Group Telephony & Server Platform Operations

How Technijian delivered 12 months of continuous 3CX VoIP, server patching, and endpoint operations across a multi-site medical practice network — with zero reported patient-facing downtime.

INDUSTRY	ENVIRONMENT	SERVICES ENGAGED	ENGAGEMENT WINDOW
Healthcare / Medical Practice	Multi-site, HIPAA-regulated	VoIP, Servers, Endpoints, M365	12 months · 184 hrs

THE CHALLENGE

A multi-practice medical group ran front-desk and clinical operations on an aging **3CX VoIP platform** sitting alongside a dozen+ Windows Server VMs — domain controllers, SQL servers, file servers, IIS hosts, SFTP, terminal servers — all critical to day-to-day patient scheduling, charting, and billing.

Patching was inconsistent, voicemail reliability issues were surfacing on desk phones, and no one owned end-to-end operational health. Clinical staff couldn't afford call drops or EHR outages, and the compliance team needed evidence that patch cycles were actually being applied.

- ✓ **Unreliable voicemail** on 3CX desk phones affecting front-desk workflow
- ✓ **Patch drift** across 10+ production servers with CVE exposure piling up
- ✓ **No centralized evidence** of patching for HIPAA technical safeguards
- ✓ **After-hours patching windows** competing with 24/7 on-call clinical access
- ✓ **No single accountable partner** — fragmented break-fix, slow response
- ✓ **Risk of EHR & phone outage** during business hours if patches failed

THE SOLUTION

Technijian took over the practice's **VoIP and server platform operations** under a managed-operations model: scheduled patch cycles tied to a documented maintenance window, proactive monitoring via ManageEngine and a central RMM, and 3CX admin support with direct end-user troubleshooting when issues surfaced.

- ✓ **Monthly patch discipline** across DC, AD, SQL, IIS, FS, SFTP, TS, and 3CX servers with documented reboot verification
- ✓ **3CX platform ownership** — user reprovisioning, desk-phone troubleshooting, voicemail fixes, and application patching with snapshot rollback
- ✓ **VMware tools upgrades** on every VM to eliminate hypervisor drift as a failure mode
- ✓ **CrowdStrike sensor currency** across healthcare endpoints, verified in portal after every update
- ✓ **Ticket-based accountability** with time-tracked work notes suitable as HIPAA compliance evidence

WORK CATEGORIES (12 MO)

ENGAGEMENT SCALE

12 MONTHS MANAGED	475+ TICKETS RESOLVED	520+ HOURS DELIVERED	10+ SERVERS PATCHED
----------------------	--------------------------	-------------------------	------------------------

THE RESULTS

Over a rolling 12-month window, Technijian delivered continuous platform operations with **no reported patient-facing downtime** traced to patching or 3CX maintenance. Front-desk voicemail reliability issues were resolved on first escalation. HIPAA compliance review had a ticket-based audit trail covering every patch cycle.

OUTCOME METRIC	RESULT
Server patch cadence	Monthly cycle maintained across 10+ production VMs (DC, AD, SQL, IIS, FS, SFTP, TS, 3CX) with verified reboot & service checks.
3CX voicemail incidents	Front-desk voicemail and provisioning issues resolved on first escalation — reprovisioning + phone config fix, no platform migration required.
CrowdStrike sensor currency	Sensor version drift eliminated across healthcare endpoints through scheduled cleanup & reinstall cycles, verified in Falcon portal.
VMware hypervisor drift	VMware tools brought current across every production VM, eliminating an entire class of failure modes from the support queue.
Compliance evidence	Every patch, reboot, and remediation logged with technician, time, and verified outcome — ready to hand to HIPAA auditors.
Accountability model	Single partner, single ticket queue, single escalation path — replacing fragmented break-fix support.

REPRESENTATIVE WORK (12 MONTHS)

VoIP rescue — Restored voicemail and desk-phone access for affected users by reprovisioning accounts in the 3CX admin portal and verifying provisioning template delivery to endpoints.

Monthly patch cycle — Applied cumulative updates, .NET framework rollups, and third-party patches (Chrome, Edge, VMware Tools, Notepad++) across the full server fleet, with snapshot safety and post-patch verification.

3CX application patching — Snapshotted the 3CX server in vCenter, applied Windows + 3CX application updates, verified services and ran test calls before releasing to production.

Server health sweeps — Logged into ManageEngine to identify unreboot servers across the fleet, pushed missing patches, and performed controlled reboots with service validation.

Endpoint security posture — Uninstalled outdated CrowdStrike sensors on drift-detected machines, reinstalled the latest Falcon sensor version, and verified sensor health in the portal.

CVE response — Tracked and applied monthly CVE-addressing cumulative updates (e.g., KB5068787, KB5071547) across the production server fleet on coordinated maintenance windows.

REPRESENTATIVE OUTCOME

“A multi-practice medical group moved from fragmented break-fix support to a single managed-operations partner — one ticket queue, one escalation path, and a documented patch and maintenance record spanning every production server and endpoint.”
