

Precision Manufacturer

Server, Backup & Network Resilience

How Technijian delivered server, backup, and network resilience for a precision manufacturer — protecting production schedules, engineering files, and customer delivery commitments.

INDUSTRY	ENVIRONMENT	SERVICES ENGAGED	ENGAGEMENT WINDOW
Precision Manufacturing	Shop floor + engineering + ERP	Server, Backup, Network, VoIP	12 months · 70+ hrs

THE CHALLENGE

A precision manufacturer with shop-floor operations, an engineering team working on CAD files, and an ERP tied to customer delivery schedules couldn't afford extended downtime. Production-stopping events meant missed ship dates and unhappy customers — with penalties in some cases.

But the IT environment had evolved ad-hoc. Backups weren't consistently verified. Server admin was reactive. The network was a tangle of legacy switches and points of failure. And the VoIP platform was due for attention. Any one of those could take production offline for a shift or more.

- ✓ **Backup verification gaps** — backups running, but restores untested
- ✓ **Reactive server admin** — no scheduled patch or health cadence
- ✓ **Legacy network gear** with single points of failure
- ✓ **VoIP platform drift** affecting customer-facing phone lines
- ✓ **No documented DR runbook** for a production-stopping event
- ✓ **Production downtime = missed ship dates** — tight tolerance for IT failure

THE SOLUTION

Technijian took over **server, backup, and network operations** with a resilience-first lens: verified backups (not just running backups), scheduled server maintenance, network hardening, and VoIP platform attention — all tracked as tickets so the plant manager can see exactly what was touched, when, and why.

- ✓ **Backup verification discipline** — backup jobs monitored, failures investigated, test restores performed to confirm recoverability
- ✓ **Scheduled server maintenance** — monthly patch cycles with snapshot safety, verified reboots, and service-up validation
- ✓ **Network hardening** — config review, single-point-of-failure remediation, and wireless coverage improvements
- ✓ **VoIP platform operations** — 3CX patching, voicemail reliability, and call-flow stability with test-call verification
- ✓ **Endpoint management** — sensor and patch currency across shop-floor and front-office Windows devices
- ✓ **Accountability & evidence** — every backup, patch, and network change lives in a ticket with time entries

PLATFORMS UNDER MANAGEMENT

Windows Server Veeam Backup Active Directory
SQL Server ManageEngine RMM 3CX VoIP
Firewall / Switching Wireless CrowdStrike Falcon
Microsoft 365

WORK CATEGORIES (12 MO)

Network · 27 tkts Backup/Recovery · 17 tkts
Server admin · 11 tkts SEO/Web · 3 tkts Endpoint · 2 tkts
VoIP proposals · 3

ENGAGEMENT SCALE

12 MONTHS MANAGED	60+ TICKETS RESOLVED	70+ HOURS DELIVERED	3 VOIP ENGAGEMENTS
----------------------	-------------------------	------------------------	-----------------------

When IT stops, production stops. Don't let backups be a surprise.

949.379.8500

THE RESULTS

Backups moved from "running" to **verified**. Server patching moved from reactive to scheduled. Network single-points-of-failure were documented and then eliminated where the plant could tolerate the change window. VoIP issues affecting customer lines were worked out of the system.

OUTCOME METRIC	RESULT
Backup verification	Backup jobs monitored on cadence; failures investigated and resolved; periodic test-restore discipline confirming recoverability — not just backup success.
Server patch cadence	Moved from reactive to scheduled monthly cycle with snapshot safety, verified reboots, and service-up validation before ticket closure.
Network resilience	Network configuration reviewed; single-points-of-failure identified and remediated where the production schedule allowed change windows.
VoIP stability	Three dedicated VoIP engagements (5h + 5h + 22h) to stabilize customer-facing phone lines and bring 3CX platform under managed operations.
Endpoint posture	Shop-floor and front-office Windows devices brought into the sensor + patch compliance picture — no more devices flying under the radar.
Production protection	Production-stopping IT event risk reduced through verified backups, scheduled maintenance, and documented change records.
Accountability	Single partner, single ticket queue, single escalation path — plant manager can see exactly what IT touched, when, and why.

REPRESENTATIVE WORK (12 MONTHS)

Backup operations — 17 tickets / 14 hours dedicated to backup job monitoring, failure investigation, remediation, and test-restore validation across production VMs.

Network operations — 27 tickets / 11 hours covering switch, firewall, and wireless configuration, incident response, and single-point-of-failure remediation.

Server admin — 11 tickets / 13 hours for scheduled and incident-driven server work, including snapshotting, patching, reboots, and service verification.

VoIP engagements — Three proposal-scoped engagements (5h + 5h + 22h) focused on 3CX platform stabilization, phone provisioning, and call-flow reliability.

Endpoint posture — 2 tickets / 2 hours of endpoint management work bringing shop-floor and front-office devices into the sensor and patch compliance picture.

Web / SEO support — 3 tickets / 5 hours on website and SEO work where IT and marketing overlap — one partner, one scope.

REPRESENTATIVE OUTCOME

"A precision manufacturer shifted from reactive server admin and unverified backups to a documented resilience program — protecting production schedules, engineering files, and customer delivery commitments with a single accountable IT partner."
