

Multi-Property Real Estate Operator Portfolio-Wide 3CX VoIP Rollout

How Technijian delivered a coordinated VoIP rollout plus endpoint-security standardization across a 30+ property portfolio — one contract, one support model, one accountable partner.

INDUSTRY	ENVIRONMENT	SERVICES ENGAGED	ENGAGEMENT WINDOW
Real Estate / Property Mgmt	30+ properties, multi-tenant	VoIP, Endpoint Sec, M365, Infra	18+ months · 1000+ hrs

THE CHALLENGE

A regional real estate operator ran a **30+ property portfolio** with no consistent telephony standard. Each site had its own phone carrier, its own routing, and its own quirks. Staff turnover at property offices meant password policies, admin accounts, and endpoint security were inconsistent from site to site.

On top of that, a corporate IT assessment flagged **significant security findings**: stale admin privileges, inactive accounts, legacy operating systems still in use, FSMO roles consolidated on a single host, and Group Policy sprawl that no one fully understood.

- ✓ **No unified VoIP platform** — 30+ sites on mixed carriers, inconsistent routing
- ✓ **Password policy gaps** and stale admin accounts across the domain
- ✓ **Legacy OS instances** still operational in production
- ✓ **FSMO single-point-of-failure** — all roles on one domain controller
- ✓ **Group Policy sprawl** with no documented ownership
- ✓ **Endpoint security drift** — outdated CrowdStrike sensors on property PCs

THE SOLUTION

Technijian packaged the work into a **multi-phase program**: a portfolio-wide 3CX VoIP rollout executed property-by-property, followed by an infrastructure remediation track covering identity, endpoint security, and Active Directory structure. Every property received a standard VoIP configuration; every endpoint was brought current on CrowdStrike; every domain finding was tracked through remediation.

- ✓ **33+ property VoIP cutovers** on a standard 3CX configuration with documented call flows and DID planning
- ✓ **Identity remediation** — password expiration policies, inactive account cleanup, admin privilege reduction
- ✓ **System & endpoint stability** — reactivated AD/non-AD machines, decommissioned legacy OS installations
- ✓ **Active Directory restructure** — redistributed FSMO roles, simplified and documented Group Policy
- ✓ **Endpoint security sweep** — CrowdStrike sensor currency across property and corporate machines
- ✓ **Network & server optimization** — addressed config drift, tuned storage, hardened web servers

PLATFORMS UNDER MANAGEMENT

3CX VoIP Active Directory Group Policy VDI / RDS
CrowdStrike Falcon Microsoft 365 Windows Server
ManageEngine RMM VMware / Hyper-V Backup & DR

PROGRAM SCOPE (BY ENGAGEMENT)

VoIP rollouts · 33+ props Gen IT · 56 proposals

Server infra · 3 proposals Network sec · 1 proposal

PROGRAM SCALE

30+ PROPERTIES SERVED	33+ VOIP CUTOVERS	1,000+ HOURS DELIVERED	5 REMEDATION PHASES
---------------------------------	-----------------------------	----------------------------------	-------------------------------

THE RESULTS

The VoIP rollout delivered a **single telephony standard** across the entire property portfolio with a consistent dial plan, unified admin, and a single support path for every front-desk phone. The remediation track closed every finding the original assessment flagged — with documented evidence suitable for insurance and compliance review.

OUTCOME METRIC	RESULT
Telephony standardization	All properties cut over to a common 3CX platform with consistent call flows, DID planning, and a single admin surface — replacing fragmented site-level carriers.
Identity & account hygiene	Password expiration policies applied, inactive accounts disabled, admin privileges reduced to essential personnel — closing a category of audit findings.
Legacy OS exposure	Decommissioned or isolated legacy operating systems flagged during assessment, eliminating unsupported platforms from production attack surface.
Active Directory resilience	FSMO roles redistributed across multiple domain controllers, removing a single-point-of-failure from the directory infrastructure.
GPO simplification	Group Policy Objects consolidated, clarified, and documented — reducing configuration drift and making future changes safer.
Endpoint security posture	CrowdStrike Falcon sensor drift eliminated portfolio-wide through routine cleanup and reinstall cycles, verified in portal after every touch.
Single accountable partner	Corporate IT now routes every property IT, VoIP, and endpoint issue through a single Technijian ticket queue — one SLA, one escalation path.

REPRESENTATIVE WORK

Property VoIP cutover — Standard 3CX configuration deployed to each property, including user extensions, DID routing, auto-attendants, voicemail, and desk-phone provisioning templates.

Identity remediation — Password expiration policies rolled out, inactive accounts inventoried and disabled, admin privileges inventoried and pruned to essential personnel.

Legacy OS retirement — Flagged, isolated, and decommissioned unsupported operating systems still in service, with formal change-management documentation.

VDI endpoint remediation — Monthly patch cycles across property management VDI pool with Microsoft Defender updates, cumulative updates, and CrowdStrike sensor upgrades.

AD structure overhaul — FSMO roles redistributed across healthy domain controllers; Group Policy Objects inventoried, consolidated, and documented with plain-language descriptions.

Endpoint security sweeps — Ongoing CrowdStrike Falcon sensor version verification across property PCs and servers, with uninstall/reinstall cycles where drift was detected.

REPRESENTATIVE OUTCOME

“A regional property operator consolidated 30+ site-level telephony contracts onto a single 3CX platform while closing every security finding from a corporate IT assessment — identity hygiene, legacy OS exposure, AD structure, GPO sprawl, and endpoint sensor drift.”
