Organic keywords today — the gap

Custom Silicon Solutions is a fabless, fab-agnostic custom-ASIC house in Irvine, California, designing analog, mixed-signal, high-voltage, and wireless silicon since 1996. It takes a design in at any stage and carries it through design, prototyping, in-house wafer and package test, and production — with engineers averaging 25-plus years and a cited 300-plus tape-outs at 100% success, for industrial, medical, aerospace-and-defense, and consumer customers. That business runs on engineering trust. This summary shows where AI builds on the firm's real strengths on two fronts, and — because Custom Silicon Solutions already runs My SEO with Technijian — it extends a relationship rather than starting one. It states only verified facts and defers every company-specific number to discovery.

Win more design wins. A design engineer now asks an AI assistant before picking up the phone; AI authority content makes the firm the cited expert that assistant names for a US custom mixed-signal ASIC partner or a drop-in replacement for an obsolete part, while account intelligence and faster RFQ responses help win the programs the business is built on. **Design and quote faster.** AI turns a loose requirement into a spec and an NRE quote, drafts datasheets and test programs, and matches an obsolete part to a drop-in replacement — with a qualified engineer confirming every parameter, and proprietary designs in private, governed systems.

What we verified

- **A US-based, fab-agnostic custom-ASIC house:** analog, mixed-signal, high-voltage, and wireless design from a napkin sketch or a finished spec, through an owned, in-house production test floor, to production silicon.
- **A genuinely hard-to-copy corner:** US-domiciled with its own Class-10,000 test clean room, a cited 100% tape-out record, 25+-year engineers, and a drop-in obsolescence-replacement practice few competitors court.
- **A real, but quiet, digital front door:** an active My SEO engagement with roughly 124 organic keywords — tiny against the firm's capabilities — and near-invisibility to AI search, exactly where buyers now start. The lowest-cost place to grow.
- **A small team of veterans:** deep expertise concentrated in a few long-tenured engineers — making knowledge capture an honest efficiency story, not just a growth one.

The one idea

A design engineer choosing a custom-ASIC partner increasingly starts with an AI assistant, and Custom Silicon Solutions — US-based, fab-agnostic, with its own test floor, a 100% tape-out record, and an obsolescence niche almost nobody else serves — is nearly invisible to that search. The firm already owns a hard-to-copy corner; the gap is that the engineers who need exactly this cannot find it. AI closes that gap on the way in, and takes the repetitive load off the experts once the work begins.

The engine

Three columns: win more design wins, design and quote faster with AI, and automate the engineering back office — each delivered by a specific Technijian service, building on the SEO already in place.

Custom Silicon Solutions AI Growth & Integration Engine

Win more design wins (left); quote and design faster (centre); automate the engineering back office (right).

* My SEO - My AI - My Dev. AI augments the engineers; a qualified engineer signs off every spec, quote, and parameter, and proprietary designs stay in private, governed deployments.

Investment & the path forward

No invented numbers. We price from real, published service ranges and model ROI only after discovery — on hours recovered per RFQ, datasheet, and test program, faster quote turnaround winning more design wins, and obsolescence searches captured, never a guessed revenue figure. The path is land-and-expand: extend the SEO you run into AI-search authority, prove one automation — RFQ-to-spec drafting or the obsolescence cross-reference is the highest-conviction first build — then scale across the back office.

The easiest first step is a short working session, with no new obligation — or a half-day AI Readiness Assessment that maps your design, RFQ, test, and documentation workflows and returns a prioritised, costed roadmap. We are in Irvine, minutes away. The full blueprint ends with a questionnaire that turns this summary into a costed plan.
