

Sensitive File Protection + Ransomware Response. Discover what's on the share, classify it, monitor it, and stop ransomware before it spreads.

## GUARDIAN CAPABILITIES

### File Discovery & Classification

SMB share scanning, sensitive-file identification (PHI / PCI / CUI / PII), ROT (redundant / obsolete / trivial) analysis, and rule-based classification across the estate.

### File Integrity Monitoring (FIM)

Baseline + change detection, permission-change alerts, ransomware heuristics, and unauthorized access notifications for sensitive shares and config files.

### DLP Enforcement for Files

In-motion policies for sensitive files: block / warn on USB, email, web upload, print, and clipboard — across endpoints and Remote Desktop Services.

### Ransomware Detection & Response

Behavioral heuristics, mass-encryption detection, automated quarantine and rollback workflows, and forensic evidence preservation for post-incident review.

## TODAY → NEXUS

### TODAY — TECHNIJIAN DELIVERY

Technijian consulting — manual file-share audits via PowerShell scripts plus Teramind rules for endpoint DLP. Effective discovery, but labor-intensive at scale.

### FUTURE — NEXUS PLATFORM

**Nexus Guardian** module — automated classification, continuous FIM, integrated DLP policies, and AI-powered ransomware response playbooks under one console.

## WHY GUARDIAN

- **Ransomware Targets Files:** Encryption hits file shares first — Guardian discovers what's there and protects it in motion.
- **You Can't Protect What You Can't See:** Most orgs don't know what sensitive data lives on shares — discovery is step zero.
- **FIM = Early Warning:** Permission changes and mass file events surface attacks before encryption completes.
- **DLP Across Endpoints + RDS:** Files are exfiltrated from endpoints and remote sessions alike — both must be covered.
- **Forensics Built-In:** Quarantine + rollback + evidence preservation lets you recover and investigate at once.

## ENGAGEMENT MODELS

| Model                           | Scope                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------|
| File Share Discovery            | Fixed-fee SMB scan, sensitive data inventory, ROT report, classification recommendations    |
| Managed Guardian Program        | Ongoing FIM, DLP tuning, ransomware playbook drills, monthly file-risk reporting            |
| Ransomware Readiness Assessment | Tabletop exercise, control gap analysis, recovery RTO/RPO validation, executive briefing    |
| Post-Incident Forensics         | Evidence preservation, timeline reconstruction, root-cause analysis, regulator-ready report |

## COMPLIANCE FRAMEWORKS SERVED

- ✓ HIPAA (PHI shares) ✓ CMMC (CUI shares) ✓ PCI-DSS (CHD) ✓ SOC 2
- ✓ GDPR ✓ NIST 800-171
