

EXECUTIVE SUMMARY

Gossamer Space Frames

AI Growth Blueprint — get found, win more work, in a solar market that is growing again

Prepared for Glenn Reynolds, Gossamer Space Frames · June 16, 2026 · Confidential

1999

Founded · Glenn Reynolds, PE

7.3 m

LAT aperture — largest at its debut

>25%

lower solar-field cost (LAT + 3M)

>99%

optical intercept, NREL-verified

First — this is not a managed-IT or security pitch

When we first reached out we led with managed IT and a security assessment, and you said you are not there yet. Fair enough — this is something different and, for a firm like yours, more valuable: using AI to get found and win more work in a concentrated-solar market that, after a quiet decade, is growing again. That is commercial growth, not IT.

Gossamer Space Frames designs and fabricates space-frame structures for concentrated solar power and architecture. Founded in 1999 by Glenn Reynolds and partners, it pioneered the LAT 73 Large Aperture Trough with 3M — a 7.3-meter-aperture collector, NREL-verified at better than 99% optical intercept, that cut solar-field cost by more than 25% — and helped build the Project-of-the-Year Martin plant for Florida Power & Light. The engineering is world-class. This summary states only verified facts, attributes all market figures, and defers company-specific numbers to discovery.

The problem is not the engineering — it is that almost no one buying these structures today can find you. Gossamer's public presence largely froze around 2012, while the parabolic-trough market quietly returned. The plan has two parts: **be found** — a modern technical presence that turns the LAT, the NREL data, and the patents into search-and-AI-citable proof; and **win more work** — AI that watches the project pipeline, finds the

developers and EPCs sourcing now, and drafts the technical outreach and proposals. AI works the front end and drafts; the team verifies every claim and owns every relationship — and it never touches the engineering.

What we verified

- **World-class, proven IP:** the LAT 73 (7.3 m aperture, >100x concentration, NREL-verified >99% intercept, >25% field-cost reduction), built with 3M; multiple U.S. patents naming Glenn Reynolds, PE; and the Project-of-the-Year Martin plant for FPL.
- **A market that has come back:** analysts put parabolic-trough CSP back on a growth track, with the fastest demand in the Middle East and North Africa and a fast-growing industrial-process-heat adjacency — trough remains the dominant CSP technology.
- **The gap is reach, not proof:** a 2012-era website, a barely-followed LinkedIn page, no living case studies, and near-zero visibility for the terms a developer actually searches — while more-visible competitors take the calls.
- **Honest about timing:** the LAT / 3M debut was 2011–2012, not recent; we treat it as a proven platform whose moment has returned, and we cite no Gossamer revenue figure because none is public and verified.

A correction we owe you, up front

Our first note called the LAT / 3M debut "recent." On research, it was proven out in 2011–2012, independently verified by NREL. We would rather be precise than flattering — and that precision is the standard behind every figure here.

The engine

Three columns — be found and tell the story, win more work, and respond and operate faster — each delivered by a specific Technijian service, with AI kept entirely on the commercial front end.

Gossamer AI Growth Engine

Be found and tell the story (left); win more work (center); respond and operate faster (right).

* My SEO · My AI · My Dev. AI works the commercial front end and drafts; a person verifies every claim and owns every relationship. It never touches the structural engineering.

Investment & the path forward

Priced from real ranges, no invented numbers. We price from published My SEO / My AI / My Dev ranges, start small — get found first, because it is the cheapest, fastest win — and model returns only after discovery. For a project-based firm, return is value at stake: a single additional contract is worth far more than a year of this engine, so it pays for itself if it wins even one opportunity that would never have reached you.

The easiest first step is a short working session on where AI creates measurable value for Gossamer — no obligation, and nothing about managed IT. The full blueprint ends with a structured questionnaire, "Questions to Complete the Analysis," that turns this summary into a costed, calibrated plan scoped to a small firm.
